The pollen in the pictures is from *N. bulbocodium*, Emerald Sea, *N. assoanus* and *N. fernandesii*. It was in the freezer since 2006. It is to be seen, that many pollen grains sprout and therefore can be used for successful pollination. Freezing is possible for pollen of all narcissus species I tried, also for *N. tazetta* and *N. viridiflorus*, which normally don't stand frost.
